

Saint-Gobain Vertex, Litomyšl

The reconstruction and construction of the Saint - Gobain Vertex manufacturing complex was carried out in several phases. First, the steel production halls were erected. Individual halls form a monoblock and they are arranged according to the succession of operations of the glass fibre manufacture, which form the core of the production process - V3 tank. In the next phase, tank V4 with a similar structure as tank V3 was built, and a steel two aisle hall of the central dispatch warehouse. The third phase included only construction of the facility for the manufacture of open mesh fabrics. One part of the building houses weaving machines, and the second part serves for finishing, formatting and packaging of technical fabrics. The building was designed as a steel construction founded on ...
